Summary

In the Japanese Pharmacopoeia (JP), microscopic examination of crude drugs is very important to decide whether or not they meet the required specifications. Observations of morphology, the size of organs or cells, and the cell contents form a key part of the JP criteria.

However, in the absence of visual information, such as schematic drawings or illustrations for each crude drug, considerable experience is needed to observe and identify internal morphology by means of microscopic observation. Therefore, the aims of this study were as follows: (1) to describe the methods for preparing tissue sections of crude drugs and related botanical materials, (2) to accumulate images of the sections, and (3) to interpret the internal morphological characteristics with the aid of these images in the context of the JP descriptions.

Key words

Japanese Pharmacopoeia, Crude drugs, Microscopic examination, Identification, Tissue sections, Internal morphology
